

Building Smarter Service Visibility

Our proprietary cleaning solutions have evolved from our intelligent Digital Cleaning Log to more complex, demand-based technologies that enable greater service transparency and functionality.

Digital Cleaning Log

ABM's Digital Cleaning Log tool captures, archives, and reports on the cleaning services we perform. Our team members scan a QR code as they carry out tasks to account for what services were completed and when. This data communicates to a dashboard with KPIs and trends that clients have direct access to, allowing greater visibility into the work performed at their facilities.

FEATURE BENEFITS

- Memorize function, QR-code functionality for easier submissions
- Geo-location for added validation
- Available in English, Spanish, and Hindi

Route-Based Task Management

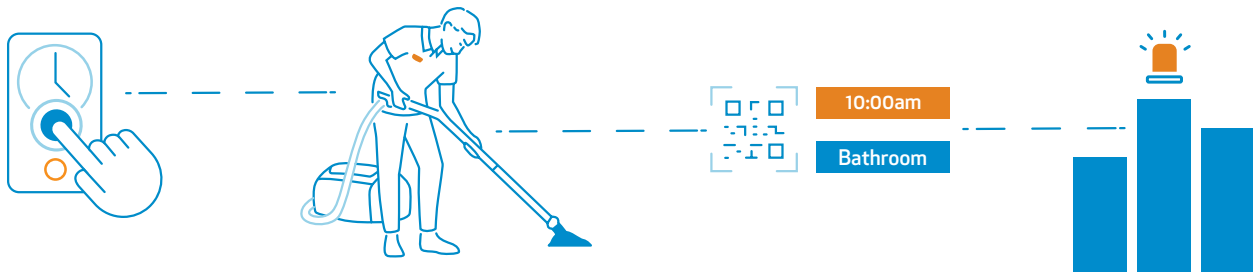

ABM developed a Route-Based Task Management solution that allows us to pre-define daily route cards and align them to team members supporting the site. Ad-hoc tasks, such as a spill clean-up, can also be added and pushed to the team member route in real-time. We utilize task performance and compliance data to reassure clients about task completion and to understand where we can adjust operations to drive better operational performance.

FEATURE BENEFITS

- Pre-assigned route cards, subtasks, and ad-hoc tasks
- Manager and team member communication
- Supporting analytics around task compliance

Smart Routing / ABM Clean

Our Smart Routing and ABM Clean solutions leverage sensor technology to enable demand-based cleaning by utilizing artificial intelligence and beacon technology. These solutions offer the ability to schedule tasks, assign resources, and leverage the technology to document compliance and allow for real-time routing to ad-hoc jobs generated by the manager, client, or occupancy-based alerts. In addition, ABM Clean contains flight data integration features for airport clients that automatically adjust staffing workflows to best service the airport and travelers.

FEATURE BENEFITS

- Costly hardware investments avoided; work with any sensor vendor, sensor data errors mitigated
- Faster response times, flight data integration, customizable thresholds
- Demand-based resourcing, beacon for real-time intelligence
